

Stopping a thief before he decides to steal a video projector is the best deterrent. If a thief doesn't know there is an alarm, he may still try to remove your video projector. Although a thief may not steal your video projector when the alarm sounds, you may be left with it destroyed. Using TekSecurity adds a deterrent by flashing a security LED.

TekSecurity is a small interface box that goes between a TekMonitor and a display device. Enabling security on the TekMonitor causes the TekVox Logo to flash. This informs anyone contemplating stealing the display device that the device is monitored by security. Using TekSecurity also reduces false security messages by informing a technician not to work on the device before disabling security.

Another benefit of TekSecurity is that it allows for an easy connection between the TekMonitor and the display device. Changing a display device becomes a very easy task by simply changing a short control cable between the device and TekSecurity.

Cable between TekSecurity and the Projector Cable is sold separately. Supplied cable between the TEK 1 and TekSecurity is a 4' flat ribbon cable.

Benefits

- Deters a thief from stealing a monitored device
- Informs a technician to disable security before servicing
- Easy to install
- Improves the installation by simplifying the control cabling
- Allows for a quick replacement of a display device

Features

- Small box design with a red flashing security logo
- RJ12 modular connections for easy installations
- Security management using a true hardware security detection method to eliminate false Email reports
