Stopping a thief before they decide to steal a video projector is the most effective form of loss prevention. If a thief doesn't know there is an alarm however, they may still try to remove your video projector. Although they may not steal your video projector when the alarm sounds, you could still be left with a destroyed unit. Using TekSecurity™ provides a deterrent by means of flashing a security LED.

TekSecurity is a small interface box that rests between a TekMonitor and a display device. Enabling security on the TekMonitor causes the TekVox Logo to flash and informs anyone who may contemplate stealing the display device that it is monitored by a security system. Using TekSecurity also reduces false security messages by informing technicians not to work on the device before disabling the security feature.

Another benefit of TekSecurity is that it provides an easy connection between the TekMonitor and display device. Changing a display device is a very easy task; simply changing a short control cable between the device and TekSecurity module.
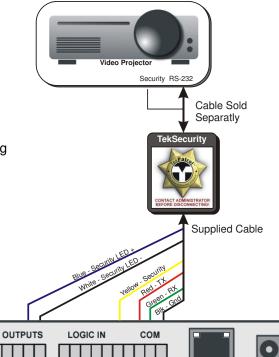

The cable between the TekSecurity and projector cable is sold separately. The supplied cable between the TekMonitor and Teksecurity is a 4' flat ribbon cable.

Benefits

- Deters a thief from stealing a monitored device
- Informs technicians to disable security before servicing
- Easy to install
- Improves the installation by simplifying the control cabling
- Allows for a quick replacement of a display device

Features

- Small box design with a red flashing security logo
- RJ12 modular connections for easy installations
- Security management uses a true hardware security detection method to eliminate false Email reports
