

TekSecurity is a small interface box that rests between a TekMonitor and a display device. Enabling security on the TekMonitor causes the TekVox Logo to flash and informs anyone who may contemplate stealing the display device that it is monitored by a security system. Using TekSecurity also reduces false security messages by informing technicians not to work on the device before disabling the security feature.

The TekSecurity provides an easy connection between the TekMonitor and display device ; simply changing a short control cable between the device and TekSecurity module.

Features:

- Anti-theft protection w/ real-time monitoring and alerts
- True hardware security detection eliminates false reports
- Requires technicians to disable security before servicing
- Simple plug-and-play installation simplifies control cabling
- Allows for a quick replacement of a display device
